PAS - White Papers

Alarm management is the application of human factors along with instrumentation engineering and systems thinking to manage the design of an alarm system to increase its usability. Most often the major usability problem is that there are too many alarms annunciated in a plant upset, commonly referred to as alarm flood, since it is so similar to a flood caused by excessive rainfall input with a basically fixed drainage output capacity. However, there can also be other problems with an alarm system

Alarm management - Wikipedia

Up to two alarms per 10-minute period (~300 alarms/day) are termed the “maximum manageable.”. More than that may be unmanageable. The acceptable alarm rates for small periods of time (such as 10 minutes or one hour) depend on the specific nature of the alarm, rather than the raw count.
