Motorola 68000 - Wikipedia
The Motorola 68000 series (also known as 680x0, m68000, m68k, or 68k) is a family of 32-bit complex instruction set computer (CISC) microprocessors. During the 1980s and early 1990s, they were popular in personal computers and workstations and were the primary competitors of Intel 's x86 microprocessors.

Motorola 68000 series - Wikipedia
The 68000 seems to have been the last major processor designed using pencil and paper. "I circulated reduced-size copies of flowcharts, execution-unit resources, decoders, and control logic to other project members," says Nick Tredennick, who designed the 68000's logic.

Motorola 68000 (MC68000) is the first member of 680x0 line of microprocessors. Internally the 68000 is a 32-bit microprocessor - it has 32-bit data and address registers. Externally the processor has 16-bit data bus and 24-bit address bus, which limits the size of addressable memory to 16 MB.

The memory space of the 68000 processor is one big linear array of memory locations, each of them being able to store one byte. The memory is said to be byte-addressable, i.e. each byte within the memory has its own unique address and can be accessed directly.

The Motorola 68000 Instruction Set can directly access up to.16 Mbytes of memory with its 24-bit Address Bus. The memory spaco may be expanded to 64 Mbytes by using the function code lines (FC 0 -FC 3). To interface 16 Mbytes of memory 68000 provides A 1 to A 23 (23) address lines along with UDS and LDS signals.

The Motorola 68020 was the first 32-bit Mac processor, first used on the Macintosh II.The 68020 had many improvements over the 68000, including an instruction cache, and was the first Mac processor to support a memory management unit, the Motorola 68851.. The Macintosh LC configured the 68020 to use a 16-bit system bus with ASICs that limited RAM to 10 MB (as opposed to the 32-bit limit of 4 GB).

The Motorola 68000 is an impressive microprocessor, and this is reflected by the large amount of addressing modes that it provides; it is actually surprising, for people used to the x86 family, to find in this microprocessor's Assembly language constructs that are very similar to the ones provided by high level languages such as pre- and postdecrements, or multiconditional branching instructions.
