Distribution Systems Reliability Analysis Package

In this paper, we describe an educational software package which is called Reliability Distribution Analysis Package (RDAP) and developed in Matlab's GUI. The package allows the student to achieve distribution system reliability analysis using different protective device, loop switches, lines/cables and repair/replacement transformers.

Reliability Analysis. Network reliability assessment is used to calculate expected interruption frequencies and annual interruption costs. Reliability analysis is an automation and probabilistic extension of contingency evaluation. The relevance of each outage is considered using statistical data about the expected frequency and duration of outages, taking into account the protection systems and the network operator's actions to re-supply interrupted customers.

The analysis is, however, greatly facilitated when software tools have been designed to make the needed operations easy. Today, several statistical packages provide capabilities for estimating separate distributions for each failure mode and making assessments of improvement in product reliability by eliminating one or more of the failure modes.
