Subsequently, rebar safety is an extremely important issue on construction sites. There are two common types of accidents associated with rebar, they are implements and abrasions. Some other hazards associated with working with rebar include - pinch points, striking other works, muscle strains due to heavy lifting, tripping, and falling hazards, etc. Unguarded protruding steel reinforcing bars are hazardous.

### PROTRUDING REBAR SAFETY AT CONSTRUCTION SITE | RLS HUMAN CARE

A rebar cage for a drilled shaft is made up of longitudinal bars that are normally distributed with equal spacing around the outside of a cylinder. Transverse reinforcing is placed around and attached to the longitudinal bars, with the longitudinal and transverse steel being held together with ties, clamps, or, in special cases, with welds.

Improving the Safety of Rebar Cages by Using Innovative Connectors Rebar cages are the skeleton of reinforced concrete components commonly used in building construction. The largest and heaviest rebar cages on the jobsite are those used in slurry wall foundations (SWF), Cast-in-Drilled Hole (CIDH) piles and tall columns.

By utilizing robots to prefabricate rebar cages and tightly integrate them with the structural design software, we strive to boost productivity, safety, and sustainability in the industry. In other words, if you are familiar with the construction industry, we want to become what DOKA and PERI are for formwork, just for rebar.
